The commitment

Organisations who join SteelZero must be willing to make a public commitment to transition to 100% Net Zero Steel by 2050.

Organisations are encouraged to commit to the most ambitious, credible target that fits with their strategy. Organisations have the option to review their commitments on an annual basis, can adjust their commitment providing it always meets the minimum criteria, and will be encouraged to increase the ambition of their commitment if possible.

Organisations must commit to achieve a set of Minimum Commitment Criteria, which have been designed to:

- send a strong market signal to steel producers to transition to the production of Net Zero Steel;
- be adoptable by organisations across all steel-using sectors;
- be globally applicable.

Minimum Commitment Criteria

1. **Long Term Commitment**: Commitment to [procuring/specifying/stocking] 100% of steel requirement by 2050 being Net Zero Steel.

2. **Interim Commitment**: Commitment to [procuring/specifying/stocking] a total of 50% of steel requirement by 2030, meeting one or a combination of the following conditions:
   a. **ResponsibleSteel™ Certified Steel**, or steel meeting an equivalent international standard.
   b. Steel produced by a steelmaking site where the site’s corporate owner has defined and made public both a long-term emissions reduction pathway and a medium-term, quantitative science-based GHG emissions target for the corporation. A science-based target approved by the SBTi (Science Based Targets initiative) or other quantitative, scientifically justified target of comparable ambition, quality and coverage would meet this interim requirement in full.
   c. **Low Embodied Carbon Steel**, as defined in Appendix A.

For example, “Organisation X” with an annual steel requirement of 100,000t could meet the Interim Commitment by procuring 25,000t of Low Embodied Carbon Steel and procuring 25,000t of ResponsibleSteel™ Certified Steel.
**Action**

SteelZero will support organisations in their journey to Net Zero Steel and in taking action on their commitment. Organisations will be invited to join working groups to assist them in developing a roadmap to fulfil their commitment to Net Zero Steel with the opportunity to share best practices to achieve the highest standards of sustainability. Working groups will be driven by the potential for driving emissions reductions and the needs of members, and will be co-ordinated by SteelZero.

An example of a working group is a regular convening of organisations across a sector-specific steel supply chain to tackle barriers to action. Wider topics may also include consideration of efficient design practices, and the shift towards the circular economy. We recognise that whilst the SteelZero commitment focuses on the decarbonisation of crude steel production, there is great scope to address broader ESG issues associated with the steel supply chain, and SteelZero will establish a working group to consider how to implement effective policies to address broader ESG issues as part of steel procurement, in consultation with its members.

Organisations are required to report to the Climate Group annually on their progress towards their SteelZero commitment. Information reported will include summaries of the quantity and embodied carbon of steel procured and will be aligned with existing standards. Additional information may be requested to clarify an organisation’s progress towards their commitment.
Appendix A - Definitions

Note: Throughout this document, we recognise carbon (C) is a key element in many steel alloys; however in this context any reference to carbon or decarbonisation is related to greenhouse gas (GHG) emissions.

**Crude Steel** is defined as Steel in the first solid state after melting, suitable for further processing or for sale. Synonymous with raw steel (adopted from worldsteel).

**Embodied Carbon** is defined as the carbon footprint of a material, in this case it is used consistently across steel using sectors to refer to the GHG emitted to produce Crude Steel.

**ESG** is defined as Environmental, Social and Governance. We refer to these issues with regards to sustainability and societal impact, and will continue to work with ResponsibleSteel and other organisations in relation to best practice around these issues.

**GHG Offsets** are discrete GHG reductions used to compensate for (i.e., offset) GHG emissions elsewhere, for example to meet a voluntary or mandatory GHG target or cap. Offsets are calculated relative to a baseline that represents a hypothetical scenario for what emissions would have been in the absence of the mitigation project that generates the offsets. To avoid double counting, the reduction giving rise to the offset must occur at sources or sinks not included in the target or cap for which it is used (adopted from The Greenhouse Gas Protocol).

**GHG Emissions Intensity** is measured in metric tonnes of CO$_2$e (CO$_2$ equivalent) per metric tonne of Crude Steel and includes direct GHG emissions from steelmaking sites (scope 1), the indirect emissions of GHGs associated with energy generation (scope 2), as well as other upstream (scope 3a) indirect GHGs of steelmaking. Scope 1, 2 and 3 emissions are as referred to in The Greenhouse Gas Protocol. The GHG Emissions Intensity will be calculated in accordance with the requirements of an applicable, recognised international and/or regional standard.

**Low Embodied Carbon Steel** is defined as crude steel with a GHG Emissions Intensity of less than or equal to the 2030 target threshold in accordance with the following formula:

\[
2030 \text{ Target Low Embodied Carbon Steel GHG Emissions Intensity threshold for crude steel} = (X \text{ tonne CO}_2 / \text{tonne}) + (1 - \% \text{ end of life scrap}) \times ((Y - X) \text{tonne CO}_2 / \text{tonne})
\]

Where:

\(X = 0.2\) metric tonnes of CO$_2$ equivalent/ metric tonne crude steel (the target GHG Emissions Intensity for Crude Steel produced in 2030 if produced from 100% end of life scrap)

\(Y = 1.4\) metric tonnes of CO$_2$ equivalent/ metric tonne Crude Steel (the target GHG Emissions Intensity for Crude Steel produced in 2030 if produced from 100% iron ore)
**Net Zero Steel** is defined as steel with a GHG emissions intensity minimised to be as close as operationally possible to zero metric tonnes of CO₂e / metric tonne crude steel and any remaining emissions offset as a last resort using a recognised offsetting framework. SteelZero is coordinating with organisations such as the World Green Building Council, C40 Cities, World Business Council for Sustainable Development and CDP to ensure a consistent approach to the definition of net zero and the use of offsets in this context.

**ResponsibleSteel Certified Steel** is defined as steel which meets the performance requirements for ResponsibleSteel steel product certification, including the applicable threshold performance level for GHG emissions. These requirements are being developed by ResponsibleSteel throughout 2020 in consultation with ResponsibleSteel members and other stakeholders. Draft specifications are available on the ResponsibleSteel website, with the expectation that they will be finalised and approved in early 2021. For further information about the ResponsibleSteel standard development see [https://www.responsiblesteel.org](https://www.responsiblesteel.org)
